

FirstWatch® Regional Influenza Update for Week

According to the CDC, at the end of Week 6 (2/9/13), reports of influenza activity in the United States continued to be elevated although there were continued declines in both diagnosed influenza and influenza-like-illness throughout the U.S. Even fewer states reported "widespread" flu activity (31) than last week. There were increases in "regional" and "local" activity reported with 14 states plus Puerto Rico and Wash., D.C. and 4 states, respectively. One state and Guam reported "sporadic". Influenza-like illness continued above expected baseline levels in all regions and deaths related to flu remained above the epidemic threshold.

As usual with seasonal flu, those being hardest hit continue to be the very young and the elderly, and many of the deaths, were in those at high risk for developing flu complications http://www.cdc.gov/flu/about/disease/high_risk.htm. There were another 5 pediatric deaths reported this week for a total of 64 for this influenza season. Compared to all deaths reported through the Mortality Reporting System, the percentage of adult deaths due to influenza & pneumonia for last week was 9.1%, and 1.6 percentage points above the epidemic threshold. Older Americans were at the greatest risk for flu complications, with more than half of the hospitalizations for those ≥ 65 years old.

The percentage of positive influenza specimens was a little lower; of the 7,608 specimens tested for influenza last week, a national average of 19.7% tested positive for influenza, down again from the previous week. Of those, 66.2% were from Influenza A and 33.8% from Influenza B; a little less A and a little more B than last week. A Regional view of positive flu specimens and their breakdown of flu types is available @ <http://www.cdc.gov/flu/weekly/>. Different Regions, and areas within those Regions, are reporting different dominant strains. An easy-to-use map of the different Regions' dominant strains can be found @ <http://gis.cdc.gov/grasp/fluview/fluportaldashboard.html>.

The percentage for outpatient visits ILI (influenza-like illness) was 3.2%, which is higher than the national baseline of 2.2%, but again lower than last week (3.6%).
